# Search for heavy, top-like quark pair production in the dilepton final state in pp collisions at $\sqrt{s} = 7$ TeV

The CMS Collaboration\*

## Abstract

The results of a search for pair production of a heavy, top-like quark,  $t'$ , in the decay mode  $t'\bar{t}' \rightarrow bW^+\bar{b}W^- \rightarrow b\ell^+\nu\bar{b}\ell^-\bar{\nu}$  are presented. The search is performed with a data sample corresponding to an integrated luminosity of  $5.0\text{ fb}^{-1}$  in pp collisions at a center-of-mass energy of 7 TeV, collected by the CMS experiment at the LHC. The observed number of events agrees with the expectation from standard model processes, and no evidence of  $t'\bar{t}'$  production is found. Upper limits on the production cross section as a function of  $t'$  mass are presented, and  $t'$  masses below  $557\text{ GeV}/c^2$  are excluded at the 95% confidence level.

## 1 Introduction

Since the discovery of the top quark at the Tevatron [1, 2], there have been many searches for a possible new generation of fermions. Those searches have found no evidence of new fermions beyond the standard model (SM). However, based on present knowledge, there is no compelling reason for the number of fermion generations to be limited to three. Additional generations of fermions may have a significant effect on neutrino, flavor, and Higgs physics. A fourth generation of quarks,  $t'$  and  $b'$ , would allow indirect bounds on the Higgs boson mass to be relaxed [3, 4], and may result in enough intrinsic matter and anti-matter asymmetry to explain the baryon asymmetry of the universe [5]. Therefore, there is continued theoretical and experimental interest in the search for a fourth generation fermion [6].

Previous direct searches restrict the masses of quarks in the fourth generation,  $M_{t'}$  and  $M_{b'}$ , to be greater than 404 and 372  $\text{GeV}/c^2$ , respectively [7, 8], and the measurement of the Z lineshape at the Large Electron-Positron collider excludes a fourth generation of light neutrinos [9–12]. At the Large Hadron Collider (LHC), the quantum chromodynamics (QCD) production cross section of  $t'\bar{t}'$  is expected to be two orders of magnitude larger than that at the Tevatron for  $M_{t'} = 500 \text{ GeV}/c^2$  [13]. This increase provides an opportunity to explore the possibility of new physics with an extended generation of fermions at higher masses.

We present a search for pair production of a heavy top-like quark in the final state  $t' \rightarrow bW \rightarrow b\ell\nu$ , where a branching fraction of 100% to  $bW$  is assumed and the charged lepton is either an electron or a muon. This search is motivated if  $M_{t'} < M_{b'} + M_W$ , which is favored by precision electroweak constraints [4, 14]. The presence of two leptons (dileptons) in the final state helps to suppress SM backgrounds, providing a clean environment to search for physics beyond the SM. The data sample corresponds to an integrated luminosity of  $5.0 \text{ fb}^{-1}$  in pp collisions at a center-of-mass energy of 7 TeV, collected by the Compact Muon Solenoid (CMS) experiment at the LHC during 2011.

## 2 CMS detector

The central feature of the CMS apparatus is a superconducting solenoid, 13 m in length and 6 m in diameter, which provides an axial magnetic field of 3.8 T. Within the field volume are several particle detection systems. Charged particle trajectories are measured by silicon pixel and silicon strip trackers, covering  $0 \leq \phi < 2\pi$  in azimuth and  $|\eta| < 2.5$  in pseudorapidity, where  $\eta = -\ln[\tan(\theta/2)]$  and  $\theta$  is the polar angle of the trajectory of the particle with respect to the counterclockwise proton beam direction. A lead tungstate crystal electromagnetic calorimeter and a brass/scintillator hadron calorimeter surround the tracking volume, providing energy measurements of electrons and hadronic jets. Muons are identified and measured in gas-ionization detectors embedded in the steel flux return yoke of the solenoid. The CMS detector is nearly hermetic, allowing energy balance measurements in the plane transverse to the beam direction. A two-tier trigger system selects pp collision events of interest for use in physics analyses. A more detailed description of the CMS detector can be found elsewhere [15].

## 3 Event samples, reconstruction, and preselection

The data used for this measurement were collected using one of the  $ee$ ,  $e\mu$ , or  $\mu\mu$  high- $p_T$  double-lepton triggers. Muon candidates are reconstructed using two algorithms that require consistent signals in the tracker and muon systems: one matches the extrapolated trajectories from the silicon tracker to signals in the muon system (tracker-based muons), and the second

performs a global fit requiring consistent patterns in the tracker and the muon system (globally fitted muons) [16]. Electron candidates are reconstructed starting from a cluster of energy deposits in the electromagnetic calorimeter. The cluster is then matched to signals in the silicon tracker. A selection using electron identification variables based on shower shape and track-cluster matching is applied to the reconstructed candidates [17]. Electron candidates within  $\Delta R \equiv \sqrt{(\Delta\eta)^2 + (\Delta\phi)^2} < 0.1$  from a muon are rejected to remove candidates due to muon bremsstrahlung and final-state radiation. Both electrons and muons are required to be isolated from other activity in the event. This is achieved by imposing a maximum allowed value of 0.15 on the ratio of the scalar sum of other transverse track momenta and transverse calorimeter energy deposits within a cone of  $\Delta R < 0.3$  around the lepton candidate direction at the origin (the transverse momentum of the candidate is excluded), to the transverse momentum of the candidate.

Event preselection is applied to reject events other than those from  $t\bar{t}$  or  $t'\bar{t}'$  in the dilepton final state. Events are required to have two opposite-sign, isolated leptons ( $e^+e^-$ ,  $e^\pm\mu^\mp$ , or  $\mu^+\mu^-$ ). Both leptons must have transverse momenta  $p_T > 20$  GeV/ $c$ , and the electrons (muons) must have  $|\eta| < 2.5$  (2.4), and must be consistent with a common interaction vertex. In the rare case ( $< 0.1\%$ ) of events with more than two such leptons, the two leptons with the highest  $p_T$  are selected. Events with an  $e^+e^-$  or  $\mu^+\mu^-$  pair with invariant mass between 76 and 106 GeV/ $c^2$  or below 12 GeV/ $c^2$  are removed to suppress Drell–Yan (DY) events ( $Z/\gamma^* \rightarrow \ell^+\ell^-$ ) as well as low mass dilepton resonances. The jets and the missing transverse energy  $E_T^{\text{miss}}$  are reconstructed with a particle-flow technique [18]. The anti- $k_T$  clustering algorithm [19] with a distance parameter of 0.5 is used for jet clustering. At least two jets with  $p_T > 30$  GeV/ $c$  and  $|\eta| < 2.5$ , separated by  $\Delta R > 0.4$  from leptons passing the analysis selection, are required in each event. Exactly two of these jets are required to be consistent with coming from the decay of heavy flavor hadrons and be identified as b jets by the TCHEM b-tagging algorithm [20], which relies on tracks with large impact parameters. The  $E_T^{\text{miss}}$  in the event is required to exceed 50 GeV.

Signal and background events are generated using the MADGRAPH 4.4.12 [21] and PYTHIA 6.4.22 [22] event generators. The samples of  $t\bar{t}$ , DY with  $M_{\ell\ell} > 50$  GeV/ $c^2$ , diboson (WW, WZ, and ZZ only: the contribution from  $W\gamma$  is assumed to be negligible), and single top quark events are generated using MADGRAPH. The DY event samples with  $M_{\ell\ell} < 50$  GeV/ $c^2$  are generated using PYTHIA. The samples of  $t'\bar{t}'$  events are generated using MADGRAPH, but decayed using PYTHIA. The  $t' \rightarrow Wb$  decay is modeled assuming a V-A structure of the interaction. Events are then simulated using a GEANT4-based model [23] of the CMS detector, and finally reconstructed and analyzed with the same software used to process collision data. The cross section for  $t\bar{t}$  production is taken from a recent CMS measurement [24], while next-to-leading order (NLO) cross sections are used for the remaining SM background samples. The  $t'\bar{t}'$  cross sections are calculated to approximate next-to-NLO (NNLO) using HATHOR [25].

With the steadily increasing LHC instantaneous luminosity, the mean number of interactions in a single bunch crossing also increased over the course of data taking, reaching about 15 at the end of the 2011 running period. In the following, the yields of simulated events are weighted such that the distribution of reconstructed vertices observed in data is reproduced. The efficiency for events containing two leptons satisfying the analysis selection to pass at least one of the double-lepton triggers is measured to be approximately 100%, 95%, and 90% for the  $ee$ ,  $e\mu$ , and  $\mu\mu$  triggers, respectively, and corresponding weights are applied to the simulated event yields. In addition, b-tagging scale factors are applied to simulated events for each jet, to account for the difference between b-tagging efficiencies in data and simulation [20].

The observed and simulated yields after the above event preselection are listed in Table 1, in

which the categories  $t\bar{t} \rightarrow \ell^+\ell^-$  and  $DY \rightarrow \ell^+\ell^-$  correspond to dileptonic  $t\bar{t}$  and DY decays, including  $\tau$  leptons only when they also decay leptonically. All other  $t\bar{t}$  decay modes are included in the category  $t\bar{t} \rightarrow \text{other}$ . The yields are dominated by top-pair production in the dilepton final state, and an agreement is observed between data and simulation. The expected yields from  $t'\bar{t}'$  are also shown for different values of  $M_{t'}$ .

Table 1: The observed and simulated yields after the preselection described in the text. Uncertainties are statistical only. The systematic uncertainties on the simulated yields are given in Section 6. For  $W + \text{jets}$ , where the simulated yields are zero, upper limits are given based on the weighted yield, had one of the simulated events passed the preselection.

## 4 Signal region

After preselection, the sample is dominated by SM  $t\bar{t}$  events. Since a  $t'$  quark is expected to have a much larger mass than that of the top quark, variables that are correlated with the decaying quark mass can help distinguish  $t'\bar{t}'$  events from  $t\bar{t}$  events. The mass of the system defined by the lepton and b jet ( $M_{lb}$ ) from the quark decay is chosen for this purpose. In the decay of a given top quark,  $M_{lb}$  is less than  $\sqrt{M_t^2 - M_W^2}$ , where  $M_t$  and  $M_W$  are the masses of the top quark and W boson. In contrast, most  $t'$  decays have  $M_{lb}$  larger than that value. At the reconstruction level, however, there are two ways to combine the two leptons and two b jets in each event, giving four possible values of  $M_{lb}$ . The minimum value of the four masses ( $M_{lb}^{\min}$ ) is found to be a good variable for distinguishing  $t'\bar{t}'$  events from  $t\bar{t}$  events, as can be seen in Fig. 1.

The signal region is defined by adding the requirement for the minimum mass of lepton and jet pairs to be  $M_{lb}^{\min} > 170 \text{ GeV}/c^2$ . This additional selection reduces the expected number of  $t\bar{t}$  events by four orders of magnitude compared with the preselection prediction given in Table 1. The simulated yields of  $t'\bar{t}'$  events are typically reduced by 50%; they are given for different values of  $M_{t'}$  in Table 2.

## 5 Background estimation

The dominant source of the migration of background events into the signal region is the misidentification of b jets and leptons. A misidentified lepton is defined as a lepton candidate not originating from a prompt decay, such as a lepton from semileptonic b or c decays, a muon from

Table 2: The expected yields of  $t\bar{t}$  events in the signal region for different values of  $M_{t'}$ . Uncertainties are statistical only.

$t\bar{t}$ sample	ee	$\mu\mu$	$e\mu$	all
$M_{t'} = 400 \text{ GeV}/c^2$	$3.5 \pm 0.5$	$5.5 \pm 0.6$	$11.2 \pm 0.9$	$20.1 \pm 1.2$
$M_{t'} = 500 \text{ GeV}/c^2$	$1.4 \pm 0.2$	$1.9 \pm 0.2$	$3.3 \pm 0.2$	$6.7 \pm 0.4$
$M_{t'} = 600 \text{ GeV}/c^2$	$0.6 \pm 0.1$	$0.6 \pm 0.1$	$1.3 \pm 0.1$	$2.5 \pm 0.1$

a pion or kaon decay, an unidentified photon conversion, or a pion misidentified as an electron. Misidentified b jets are referred to as “mistags”, and occur when a non-b jet satisfies the b-tagging requirements.

The background events in the signal region can be divided into the following categories:

- Category I: events with mistagged b jet(s) and two real leptons;
- Category II: events with misidentified lepton(s) and two real b jets;
- Category III: events with two real b jets and two real leptons;
- Category IV: events with mistagged b jet(s) and misidentified lepton(s).

For each category, an estimate of the combined yield of ee,  $e\mu$ , and  $\mu\mu$  events is made.

To predict the number of events with mistagged b jet(s) (Category I), control regions in data are used where events pass all selection requirements except the number of b-tagged jets. The number of background events with one mistag,  $N_{1\text{mistag}}$ , is estimated from events with one b tag. Each event is weighted based on the mistag rate  $r_i$  for each untagged jet in the event, where  $r_i$  gives the  $p_T$ - and  $\eta$ -dependent probability (with a mean of 0.02) for a non-b jet to be b-tagged [20]. Where there are no untagged jets passing the selection, the event weight is zero, and for each untagged jet  $i$  passing the selection the event weight is increased by  $r_i / (1 - r_i)$ . The subtraction of  $r_i$  in the denominator is necessary to account for non-b jets that were mistagged, and are thus missing from the sample of untagged jets. A similar calculation is made using events with no b tags to estimate the number of events with two mistags,  $N_{2\text{mistags}}$ . This time a weight of  $r_i / (1 - r_i) \times r_j / (1 - r_j)$  is used for each pair of untagged jets passing selection, where  $r_i$  and  $r_j$  are the mistag rates for the two untagged jets. The final prediction is obtained as  $N_{\text{mistags}} = N_{1\text{mistag}} - N_{2\text{mistags}}$ , which takes into account that  $N_{2\text{mistags}}$  is counted twice in  $N_{1\text{mistag}}$ . The performance of the method is checked using simulated events, and an under-prediction of up to 50% is observed. We therefore assign a large systematic uncertainty, 100%, to this prediction. In data, the predicted number of events with mistags in the signal region is  $N_{\text{mistags}} = 0.7 \pm 0.3 \pm 0.7$ , where the uncertainties are statistical and systematic, respectively. The Category I yield expected from simulation, taken as a cross-check, is  $1.0 \pm 0.3$ , and is consistent with the prediction based on data.

The background from events with misidentified leptons (Category II) is predicted based on the number of events in data with a candidate lepton that can pass only loosened selection criteria [26]. Using a measurement of the fraction of such “loose” leptons that go on to pass the selection requirements, the number of misidentified leptons in the event sample can be estimated. However, there are no observed data events where one or more of the lepton candidates passes only the loosened selection criteria, resulting in a prediction of  $0.0^{+0.4}_{-0.0}$  events where the upper uncertainty corresponds to the prediction of the method, had there been one such event. The Category II event yield is also zero in the simulation.

The simulation is used to predict the number of events with no misidentified b jets or leptons

(Category III). Selecting only events where both  $b$  jets and leptons are well matched to the corresponding particles at the generator level, the resulting prediction is  $1.0 \pm 0.7$  where the uncertainty is statistical. The systematic uncertainty is small in comparison (Section 6), so the total uncertainty is also 0.7.

The contribution of events from Category IV is assumed to be negligible and is covered by both the Category I and Category II predictions. Since the Category II prediction is zero, there is no possibility of double-counting.

## 6 Systematic uncertainties

The systematic uncertainty on the overall selection efficiency is dominated by the uncertainty on the  $b$ -tagging efficiency. This uncertainty is 15% for  $b$  jets with  $p_T > 240 \text{ GeV}/c$ , and 4% for  $b$  jets with  $p_T \leq 240 \text{ GeV}/c$  [20]. Other uncertainties include those on trigger efficiency (2%), lepton selection (2%), and jet and  $E_T^{\text{miss}}$  energy scale (8%) [27]. These four sources combine to yield a 19% relative uncertainty on the overall selection efficiency. There is a further 2.2% uncertainty on the luminosity measurement [28].

The systematic uncertainty on the background estimate is dominated by the uncertainty on the estimate of events with mistagged  $b$  jets from data (100%), and by the lack of selected events in the loose-lepton control region. The systematic uncertainties on these sources of background are included in the summary of background predictions given in Table 3.

## 7 Results and summary

The number of expected events from background processes is  $1.8 \pm 1.1$ , and one event is observed in the  $e\mu$  channel. There is thus no evidence for an excess of events above SM expectations. A summary of the observed and predicted yields is presented in Table 3.

The simulated distribution of  $M_{b\bar{b}}^{\text{min}}$  from background processes is compared with the data in Fig. 1, where the expected distribution for a  $t'\bar{t}'$  signal with  $M_{t'} = 450 \text{ GeV}/c^2$  is also shown. The simulated background yields in the signal region are scaled so that they match the yields estimated from control regions in data, as given in Table 3. Outside the signal region the simulated background yields are taken without rescaling.

Table 3: Summary of the predicted background yields and the measured yield in data. Statistical and systematic uncertainties are combined.

Sample	Yield
Category I (from data)	$0.7 \pm 0.8$
Category II (from data)	$0.0^{+0.4}_{-0.0}$
Category III (simulated)	$1.0 \pm 0.7$
Total prediction	$1.8 \pm 1.1$
Data	1

Finally, 95% confidence level (CL) upper limits on the production cross section of  $t'\bar{t}'$  as a function of  $t'$  mass are set, using the CL<sub>s</sub> method [29, 30], in which a log-normal model of nuisance parameter integration is assumed.

The limit calculation is based on the information provided by the observed event count combined with the values and the uncertainties of the luminosity measurement, the background

Figure 1: Comparison between the data and the simulated background for  $M_{\ell b}^{\min}$ . The signal region is defined by  $M_{\ell b}^{\min} > 170 \text{ GeV}/c^2$ . The simulated background yields in the signal region are scaled so that they match the yields estimated from control regions in data, as given in Table 3. Outside the signal region the simulated background yields are taken without rescaling. One event is observed in the signal region. The expected distribution for a  $t't'$  signal with  $M_{t'} = 450 \text{ GeV}/c^2$  is also shown.

prediction, and the fraction of  $t't'$  events expected to be selected. This fraction (the overall selection efficiency) is taken as the product of efficiency, acceptance, and the branching fraction for simulated signal events, and is given in Table 4 for different values of  $M_{t'}$ . The calculated limits are shown in Table 5 and Fig. 2.

In summary, assuming a branching fraction of 100% for  $t' \rightarrow bW$ , the expected and observed 95% CL lower bounds on the  $t'$  mass are  $547$  and  $557 \text{ GeV}/c^2$ , respectively, from the analysis of a data sample of pp collisions at  $\sqrt{s} = 7 \text{ TeV}$ , corresponding to an integrated luminosity of  $5.0 \text{ fb}^{-1}$ .

Table 4: Overall selection efficiency in simulated events for different  $t'$  masses. The branching fraction of 6.5% for the dilepton decay mode of  $t't'$  is included. The uncertainties are calculated using the systematic uncertainty of 19% from Section 6.

$t't'$ sample	Eff $\times$ Acc $\times$ Br (%)
$M_{t'} = 350 \text{ GeV}/c^2$	$0.16 \pm 0.03$
$M_{t'} = 400 \text{ GeV}/c^2$	$0.29 \pm 0.06$
$M_{t'} = 450 \text{ GeV}/c^2$	$0.35 \pm 0.07$
$M_{t'} = 500 \text{ GeV}/c^2$	$0.41 \pm 0.08$
$M_{t'} = 550 \text{ GeV}/c^2$	$0.48 \pm 0.09$
$M_{t'} = 600 \text{ GeV}/c^2$	$0.54 \pm 0.10$

Table 5: The approximate NNLO theoretical cross section of  $t'\bar{t}'$  production assuming standard QCD couplings [25], and the expected and observed 95% CL upper limits on the production cross section of  $t'\bar{t}'$ , for different  $t'$  masses.

$M_{t'}$ (GeV/ $c^2$ )	350	400	450	500	550	600
Theoretical cross section (pb)	3.20	1.41	0.62	0.33	0.17	0.09
Expected limit (pb)	0.53	0.29	0.24	0.21	0.18	0.16
Observed limit (pb)	0.47	0.26	0.22	0.18	0.16	0.14

Figure 2: The 95% CL upper limits on the production cross section of  $t'\bar{t}'$  as a function of  $t'$  mass. The observed (expected) 95% CL lower bound on  $M_{t'}$  is 557 (547) GeV/ $c^2$ .

## Acknowledgment

We congratulate our colleagues in the CERN accelerator departments for the excellent performance of the LHC machine. ## A The CMS Collaboration

### **Yerevan Physics Institute, Yerevan, Armenia**

S. Chatrchyan, V. Khachatryan, A.M. Sirunyan, A. Tumasyan

### **Institut für Hochenergiephysik der OeAW, Wien, Austria**

W. Adam, T. Bergauer, M. Dragicevic, J. Erö, C. Fabjan, M. Friedl, R. Frühwirth, V.M. Ghete, J. Hammer<sup>1</sup>, N. Hörmann, J. Hrubec, M. Jeitler, W. Kiesenhofer, M. Krammer, D. Liko, I. Mikulec, M. Pernicka<sup>†</sup>, B. Rahbaran, C. Rohringer, H. Rohringer, R. Schöffbeck, J. Strauss, A. Taurok, F. Teischinger, P. Wagner, W. Waltenberger, G. Walzel, E. Widl, C.-E. Wulz

### **National Centre for Particle and High Energy Physics, Minsk, Belarus**

V. Mossolov, N. Shumeiko, J. Suarez Gonzalez

### **Universiteit Antwerpen, Antwerpen, Belgium**

S. Bansal, K. Cerny, T. Cornelis, E.A. De Wolf, X. Janssen, S. Luyckx, T. Maes, L. Mucibello, S. Ochesanu, B. Roland, R. Rougny, M. Selvaggi, H. Van Haevermaet, P. Van Mechelen, N. Van Remortel, A. Van Spilbeeck

### **Vrije Universiteit Brussel, Brussel, Belgium**

F. Blekman, S. Blyweert, J. D'Hondt, R. Gonzalez Suarez, A. Kalogeropoulos, M. Maes, A. Olbrechts, W. Van Doninck, P. Van Mulders, G.P. Van Onsem, I. Villella

### **Université Libre de Bruxelles, Bruxelles, Belgium**

O. Charaf, B. Clerbaux, G. De Lentdecker, V. Dero, A.P.R. Gay, T. Hreus, A. Léonard, P.E. Marage, T. Reis, L. Thomas, C. Vander Velde, P. Vanlaer

### **Ghent University, Ghent, Belgium**

V. Adler, K. Beernaert, A. Cimmino, S. Costantini, G. Garcia, M. Grunewald, B. Klein, J. Lellouch, A. Marinov, J. McCartin, A.A. Ocampo Rios, D. Ryckbosch, N. Strobbe, F. Thyssen, M. Tytgat, L. Vanelderen, P. Verwilligen, S. Walsh, E. Yazgan, N. Zaganidis

### **Université Catholique de Louvain, Louvain-la-Neuve, Belgium**

S. Basesmez, G. Bruno, L. Ceard, C. Delaere, T. du Pree, D. Favart, L. Forthomme, A. Giammanco<sup>2</sup>, J. Hollar, V. Lemaitre, J. Liao, O. Militaru, C. Nuttens, D. Pagano, A. Pin, K. Piotrkowski, N. Schul

### **Université de Mons, Mons, Belgium**

N. Beliy, T. Caebergs, E. Daubie, G.H. Hammad

### **Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro, Brazil**

G.A. Alves, M. Correa Martins Junior, D. De Jesus Damiao, T. Martins, M.E. Pol, M.H.G. Souza

### **Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil**

W.L. Aldá Júnior, W. Carvalho, A. Custódio, E.M. Da Costa, C. De Oliveira Martins, S. Fonseca De Souza, D. Matos Figueiredo, L. Mundim, H. Nogima, V. Oguri, W.L. Prado Da Silva, A. Santoro, S.M. Silva Do Amaral, L. Soares Jorge, A. Sznajder

### **Instituto de Fisica Teorica, Universidade Estadual Paulista, Sao Paulo, Brazil**

T.S. Anjos<sup>3</sup>, C.A. Bernardes<sup>3</sup>, F.A. Dias<sup>4</sup>, T.R. Fernandez Perez Tomei, E. M. Gregores<sup>3</sup>, C. Lagana, F. Marinho, P.G. Mercadante<sup>3</sup>, S.F. Novaes, Sandra S. Padula

### **Institute for Nuclear Research and Nuclear Energy, Sofia, Bulgaria**

V. Genchev<sup>1</sup>, P. Iaydjiev<sup>1</sup>, S. Piperov, M. Rodozov, S. Stoykova, G. Sultanov, V. Tcholakov, R. Trayanov, M. Vutova

**University of Sofia, Sofia, Bulgaria**

A. Dimitrov, R. Hadjiiska, V. Kozhuharov, L. Litov, B. Pavlov, P. Petkov

**Institute of High Energy Physics, Beijing, China**

J.G. Bian, G.M. Chen, H.S. Chen, C.H. Jiang, D. Liang, S. Liang, X. Meng, J. Tao, J. Wang, J. Wang, X. Wang, Z. Wang, H. Xiao, M. Xu, J. Zang, Z. Zhang

**State Key Lab. of Nucl. Phys. and Tech., Peking University, Beijing, China**

C. Asawatrangkuldee, Y. Ban, S. Guo, Y. Guo, W. Li, S. Liu, Y. Mao, S.J. Qian, H. Teng, S. Wang, B. Zhu, W. Zou

**Universidad de Los Andes, Bogota, Colombia**

C. Avila, B. Gomez Moreno, A.F. Osorio Oliveros, J.C. Sanabria

**Technical University of Split, Split, Croatia**

N. Godinovic, D. Lelas, R. Plestina<sup>5</sup>, D. Polic, I. Puljak<sup>1</sup>

**University of Split, Split, Croatia**

Z. Antunovic, M. Dzelalija, M. Kovac

**Institute Rudjer Boskovic, Zagreb, Croatia**

V. Brigljevic, S. Duric, K. Kadija, J. Luetic, S. Morovic

**University of Cyprus, Nicosia, Cyprus**

A. Attikis, M. Galanti, G. Mavromanolakis, J. Mousa, C. Nicolaou, F. Ptochos, P.A. Razis

**Charles University, Prague, Czech Republic**

M. Finger, M. Finger Jr.

**Academy of Scientific Research and Technology of the Arab Republic of Egypt, Egyptian Network of High Energy Physics, Cairo, Egypt**

Y. Assran<sup>6</sup>, S. Elgammal, A. Ellithi Kamel<sup>7</sup>, S. Khalil<sup>8</sup>, M.A. Mahmoud<sup>9</sup>, A. Radi<sup>8,10</sup>

**National Institute of Chemical Physics and Biophysics, Tallinn, Estonia**

M. Kadastik, M. Müntel, M. Raidal, L. Rebane, A. Tiko

**Department of Physics, University of Helsinki, Helsinki, Finland**

V. Azzolini, P. Eerola, G. Fedi, M. Voutilainen

**Helsinki Institute of Physics, Helsinki, Finland**

J. Härkönen, A. Heikkinen, V. Karimäki, R. Kinnunen, M.J. Kortelainen, T. Lampén, K. Lassila-Perini, S. Lehti, T. Lindén, P. Luukka, T. Mäenpää, T. Peltola, E. Tuominen, J. Tuominiemi, E. Tuovinen, D. Ungaro, L. Wendland

**Lappeenranta University of Technology, Lappeenranta, Finland**

K. Banzuzi, A. Korpela, T. Tuuva

**DSM/IRFU, CEA/Saclay, Gif-sur-Yvette, France**

M. Besancon, S. Choudhury, M. Dejardin, D. Denegri, B. Fabbro, J.L. Faure, F. Ferri, S. Ganjour, A. Givernaud, P. Gras, G. Hamel de Monchenault, P. Jarry, E. Locci, J. Malcles, L. Millischer, A. Nayak, J. Rander, A. Rosowsky, I. Shreyber, M. Titov

**Laboratoire Leprince-Ringuet, Ecole Polytechnique, IN2P3-CNRS, Palaiseau, France**

S. Baffioni, F. Beaudette, L. Benhabib, L. Bianchini, M. Bluj<sup>11</sup>, C. Broutin, P. Busson, C. Charlot, N. Daci, T. Dahms, L. Dobrzynski, R. Granier de Cassagnac, M. Haguenaue, P. Miné, C. Mironov, C. Ochando, P. Paganini, D. Sabes, R. Salerno, Y. Sirois, C. Veelken, A. Zabi

**Institut Pluridisciplinaire Hubert Curien, Université de Strasbourg, Université de Haute Alsace Mulhouse, CNRS/IN2P3, Strasbourg, France**

J.-L. Agram<sup>12</sup>, J. Andrea, D. Bloch, D. Bodin, J.-M. Brom, M. Cardaci, E.C. Chabert, C. Collard, E. Conte<sup>12</sup>, F. Drouhin<sup>12</sup>, C. Ferro, J.-C. Fontaine<sup>12</sup>, D. Gelé, U. Goerlach, P. Juillot, M. Karim<sup>12</sup>, A.-C. Le Bihan, P. Van Hove

**Centre de Calcul de l'Institut National de Physique Nucleaire et de Physique des Particules (IN2P3), Villeurbanne, France**

F. Fassi, D. Mercier

**Université de Lyon, Université Claude Bernard Lyon 1, CNRS-IN2P3, Institut de Physique Nucléaire de Lyon, Villeurbanne, France**

S. Beauceron, N. Beaupere, O. Bondu, G. Boudoul, H. Brun, J. Chasserat, R. Chierici<sup>1</sup>, D. Contardo, P. Depasse, H. El Mamouni, J. Fay, S. Gascon, M. Gouzevitch, B. Ille, T. Kurca, M. Lethuillier, L. Mirabito, S. Perries, V. Sordini, S. Tosi, Y. Tschudi, P. Verdier, S. Viret

**E. Andronikashvili Institute of Physics, Academy of Science, Tbilisi, Georgia**

L. Rurua

**RWTH Aachen University, I. Physikalisches Institut, Aachen, Germany**

G. Anagnostou, S. Beranek, M. Edelhoff, L. Feld, N. Heracleous, O. Hindrichs, R. Jussen, K. Klein, J. Merz, A. Ostapchuk, A. Perieanu, F. Raupach, J. Sammet, S. Schael, D. Sprenger, H. Weber, B. Wittmer, V. Zhukov<sup>13</sup>

Lazaridis, J. Leonard, R. Loveless, A. Mohapatra, I. Ojalvo, G.A. Pierro, I. Ross, A. Savin, W.H. Smith, J. Swanson

†: Deceased

1: Also at CERN, European Organization for Nuclear Research, Geneva, Switzerland

- 2: Also at National Institute of Chemical Physics and Biophysics, Tallinn, Estonia
- 3: Also at Universidade Federal do ABC, Santo Andre, Brazil
- 4: Also at California Institute of Technology, Pasadena, USA
- 5: Also at Laboratoire Leprince-Ringuet, Ecole Polytechnique, IN2P3-CNRS, Palaiseau, France
- 6: Also at Suez Canal University, Suez, Egypt
- 7: Also at Cairo University, Cairo, Egypt
- 8: Also at British University, Cairo, Egypt
- 9: Also at Fayoum University, El-Fayoum, Egypt
- 10: Now at Ain Shams University, Cairo, Egypt
- 11: Also at Soltan Institute for Nuclear Studies, Warsaw, Poland
- 12: Also at Université de Haute-Alsace, Mulhouse, France
- 13: Also at Moscow State University, Moscow, Russia
- 14: Also at Brandenburg University of Technology, Cottbus, Germany
- 15: Also at Institute of Nuclear Research ATOMKI, Debrecen, Hungary
- 16: Also at Eötvös Loránd University, Budapest, Hungary
- 17: Also at Tata Institute of Fundamental Research - HECR, Mumbai, India
- 18: Now at King Abdulaziz University, Jeddah, Saudi Arabia
- 19: Also at University of Visva-Bharati, Santiniketan, India
- 20: Also at Sharif University of Technology, Tehran, Iran
- 21: Also at Isfahan University of Technology, Isfahan, Iran
- 22: Also at Shiraz University, Shiraz, Iran
- 23: Also at Plasma Physics Research Center, Science and Research Branch, Islamic Azad University, Teheran, Iran
- 24: Also at Facoltà Ingegneria Università di Roma, Roma, Italy
- 25: Also at Università della Basilicata, Potenza, Italy
- 26: Also at Università degli Studi Guglielmo Marconi, Roma, Italy
- 27: Also at Università degli studi di Siena, Siena, Italy
- 28: Also at Faculty of Physics of University of Belgrade, Belgrade, Serbia
- 29: Also at University of Florida, Gainesville, USA
- 30: Also at University of California, Los Angeles, Los Angeles, USA
- 31: Also at Scuola Normale e Sezione dell' INFN, Pisa, Italy
- 32: Also at INFN Sezione di Roma; Università di Roma "La Sapienza", Roma, Italy
- 33: Also at University of Athens, Athens, Greece
- 34: Also at Rutherford Appleton Laboratory, Didcot, United Kingdom
- 35: Also at The University of Kansas, Lawrence, USA
- 36: Also at Paul Scherrer Institut, Villigen, Switzerland
- 37: Also at Institute for Theoretical and Experimental Physics, Moscow, Russia
- 38: Also at Gaziosmanpasa University, Tokat, Turkey
- 39: Also at Adiyaman University, Adiyaman, Turkey
- 40: Also at The University of Iowa, Iowa City, USA
- 41: Also at Mersin University, Mersin, Turkey
- 42: Also at Kafkas University, Kars, Turkey
- 43: Also at Suleyman Demirel University, Isparta, Turkey
- 44: Also at Ege University, Izmir, Turkey
- 45: Also at School of Physics and Astronomy, University of Southampton, Southampton, United Kingdom
- 46: Also at INFN Sezione di Perugia; Università di Perugia, Perugia, Italy
- 47: Also at University of Sydney, Sydney, Australia
- 48: Also at Utah Valley University, Orem, USA

49: Also at Institute for Nuclear Research, Moscow, Russia

50: Also at University of Belgrade, Faculty of Physics and Vinca Institute of Nuclear Sciences, Belgrade, Serbia

51: Also at Argonne National Laboratory, Argonne, USA

52: Also at Erzincan University, Erzincan, Turkey

53: Also at Kyungpook National University, Daegu, Korea
